### **HOTEL MANAGEMENT SYSTEM**

**COURSE CODE- CSE310 ( PROGRAMMING IN JAVA )**

**Submitted by:-**

**ASHUTOSH KUMAR**

**Submitted to-Dr. Bhimasen Moharana(28066)**

to the department of

**“P132:B.Tech(Computer Science & Engineering)”**

**“School of Computer Science & Engineering”**

**Lovely Professional University**

**Phagwara, Punjab**

## **DECLARATION**

I declare that project entitled “**Hotel Management System**” is our own work conducted under the supervision of “**Dr. Bhimasen Moharana**”, Department of **CSE, Lovely Professional University, Punjab**

I further declare that, to the best of our knowledge the project does not contain any work which has been submitted for the award of the degree either in the University or in any other University/Deemed University without proper citations.

## **Acknowledgment**

I wish to express my sincere gratitude to God for his protection, providence, guidance and above all, for sustaining us.

I would like to express our special thanks of gratitude to our professor '**Dr. Bhimasen Moharana**' who gave me the golden opportunity to do this wonderful **project** on the topic '**Hotel Management System**', which also helped me in doing a lot of Research and gaining some precious .

### **Abstract**

In this project "**Hotel Management System**" we have tried to show how the data/information in hotels is managed. This is just an overview of management in hotels. It manages and maintains the records of customers, rooms, employees and drivers in the hotel. The project is aimed to maintain the day-to-day state of admission/vacation of Residents, List of employees, room details etc. Main objective of this project is to provide solution for hotel to manage most there work using computerized process. This software application will help admin to handle customer information, room allocation details, Payment details etc.

The rooms have different categories like single bed, double bed etc. so their charges and records will be maintained accordingly.

This software has been made in a user friendly interface, so that anyone can add, delete, update the entries and handle all

the transactions easily. As a security I have provided Admin username and Password.

## **Introduction**

The project, Hotel Management System is a desktop-based application that allows the hotel manager to handle all hotel activities online. Interactive GUI and the ability to manage various rooms, employees, drivers and customers make this system very flexible and convenient. The hotel manager is a very busy person and does not have the time to sit and manage the entire activities manually on paper. This application gives him the power and flexibility to manage the entire system from a single online system. Hotel management project provides room booking, staff management and other necessary hotel management features. The system allows the manager to post available rooms in the system.

The Purpose of the whole process is to ease the daily or regular activities of the Hotel Management into an automatic computerized retrievable process. The daily activities includes the Room activities, Entering details of the new customer check in, To allocate a room as per the customer need and interest, Recording the checkout time and details, Releasing or Empty of room and to record the process in a computer system for future.

## **Contribution**

---

Hotel Management Software is programmed to enable HR professionals for managing the data and information of the company's employees on a regular basis. The easy information regarding the employees is including contact details, investment details, and much more.

**Accuracy:**

Your system must be able to accommodate your employees and various customers or guests at your hotel. Once a good system is in place, you will have an accurate record of the check-in and check-out status of a customer. An automated system minimizes the possibility of human error, as the only real factor is whether employees remember to clock in and out.

**Record-Keeping:**

Another feature of a hotel management system is that it can be used to keep detailed and accurate records. These records can be stored in a main database on site, online or in an outside record-keeping facility.

Record-keeping can help you monitor trends such as how much overtime you're paying and how many employees participate in your company retirement plans.

**Feasibility Study**

To analyze whether the software will meet organizational requirements Feasibility is defined as the practical extent to which a project can be performed successfully. To evaluate feasibility, a feasibility study is performed.

To determine whether the software can be implemented using the current technology and within the specified budget and schedule A feasibility study is a preliminary investigation of a proposed system

to decide whether the system can run smoothly with the organization.

To determine whether the software can be integrated with other existing software .benefits that are expected and to decide will the organization go for it.

### Three Types of feasibility study

#### *1. Technical Feasibility.*

Ascertains that the technology chosen for software development has a large number of users so that they can be consulted when problems arise or improvements are required

#### *2. Operational Feasibility.*

Analyzes whether users will adapt to a new software .Determines whether the organization is satisfied by the alternative solutions proposed by the software development team

#### *3. Economical Feasibility*

Cost of hardware, software, development team, and training.  
Feasible only if tangible and intangible benefits outweigh the cost.  
The cost for proposed online shopping system is outweighing the cost and efforts involved

## REQUIREMENT SPECIFICATION

### User Requirements

There should be software which allocates rooms automatically and maintains records of customers.

### System Requirements

There should be a database backup of the hotel management system. There should be a Java supported framework for the system. Operating system should be WindowsXP or a higher version of windows.

### User Interface

The User interface required to be developed for the system should be user friendly and attractive.

There are two sets of java APIs for graphics programming:

AWT (Abstract Windowing Toolkit) and Swing.

- AWT API was introduced in JDK 1.0. Most of the AWT components have become obsolete and should be replaced by newer Swing components.
- Swing API, a much more comprehensive set of graphics libraries that enhances the AWT, was introduced as part of Java Foundation Classes (JFC) after the release of JDK 1.1. JFC consists of Swing, Java2D, Accessibility, Internationalization, and Pluggable Look-and-Feel Support APIs. JFC was an add-on to JDK 1.1 but has been integrated into core Java since JDK 1.2.

For the development of this project both hardware and software were required. The hard required is any machine compatible for running the softwares and resources required.

### Software Requirements

- Operating System      Windows 10
- Front End                Java, NetBeans
- Back End                 MySQL

### **Hardware Requirements**

- Desktop PC or a Laptop
- Printer
- Operating System – Windows 10
- Intel® Core™ i3-6006U CPU @ 2.00GHz
- 4.00 GB RAM
- 64-bit operating system, x64 based processor
- 1024 x 768 monitor resolution
- Keyboard and Mouse

### **Administrative Modules**

There are 2 modules I have included in this project :

1. Admin : Admin can add a new room , a new employee and a new driver.
2. Receptionist : Receptionist can add a new customer and allocate rooms, can check all room details, customers details, employee details, search for a particular room etc.

### **Main Objective**

Main objective of this project is to provide solution for hotel to manage most there work using computerized process. This software application will help admin to handle customer information, room allocation details, Payment details etc.

- Keeping records of admission of customers.
- Facilities provided by Hotel are fully utilized in effective and efficient manner.

### **Existing System:**

In the existing manual system a lot of time is spent in communicating the information across different branches. There is a need for an automated system, which has some centralized control over the entire process. Conventional System makes use of huge amounts of paper for recording transactions. All the Hotel records are to be maintained for the details of each customer, Fee details, Room Allocation etc.

### **Disadvantages:**

- Time consuming
- Inaccuracy of data

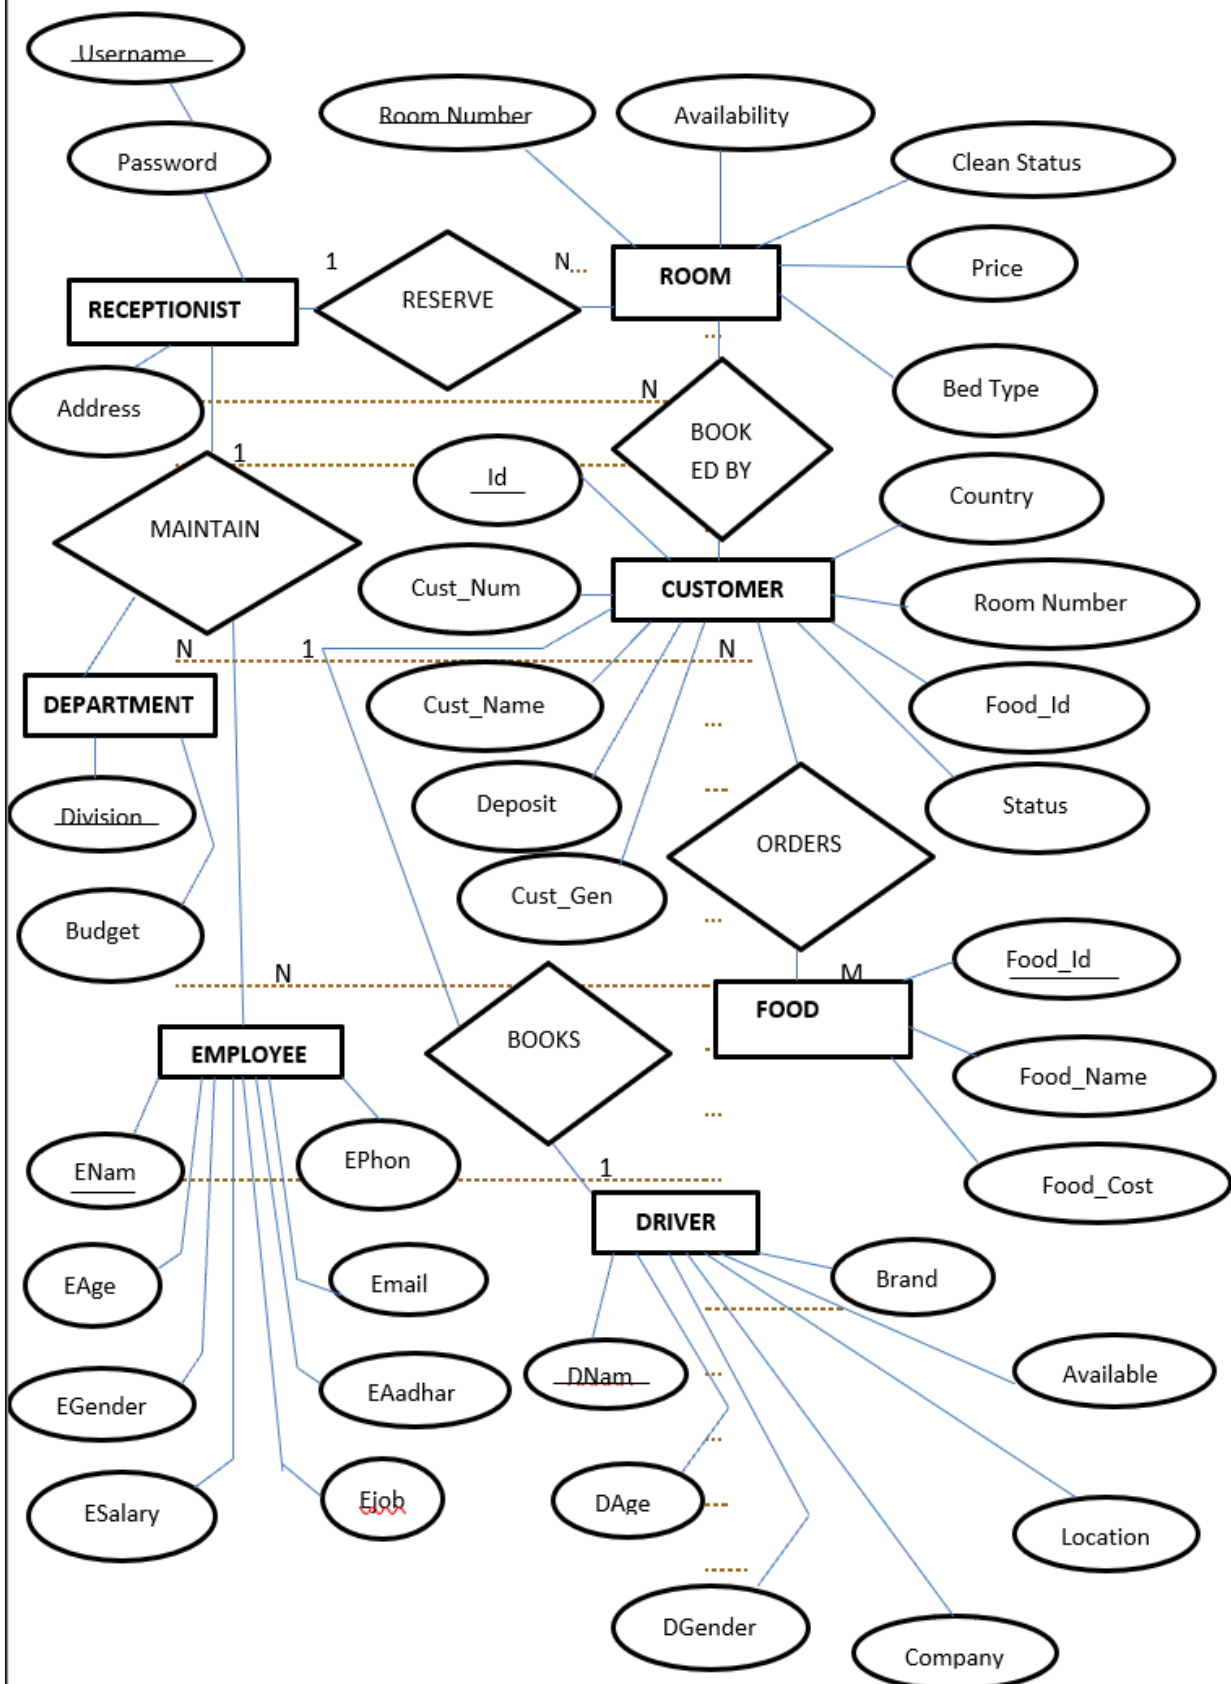

### **Proposed System:**

Proposed system is the computerized version of the existing system which provides easy and quick access over the data. Keeping the records of admission of Resident properly so that facilities provided by Hotels are fully utilized in effective and efficient manner.

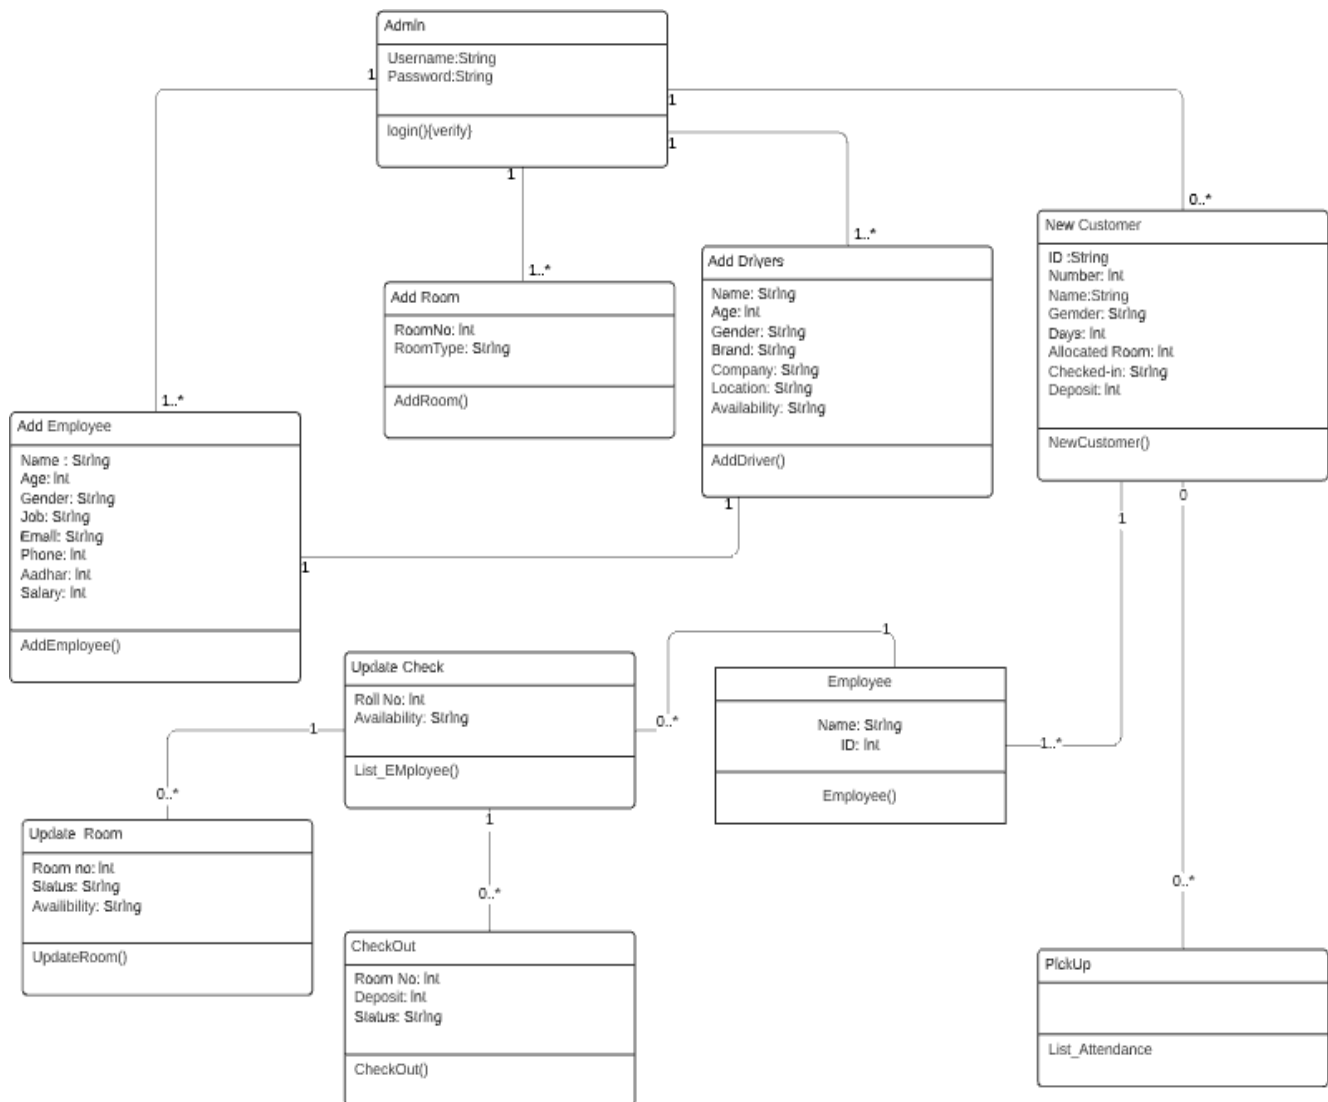

### **Advantages:**

- Less Time consuming
- Maintain accuracy

## 11. Check In Details

The screenshot shows a web application window titled "Hotel Management Admin". The main banner at the top says "THE TAJ GROUP WELCOMES YOU" over a background image of a hotel at night. In the center, there is a "Check-in Details" form with the following fields:

- Customer-Id (dropdown menu)
- Room Number (text input)
- Name (text input)
- Check-In (text input)
- Amount Paid (text input)
- Pending Amount (text input)

Below the form are three buttons: "Update", "Check", and "Back". To the right of the form is a graphic with two large arrows: a right-pointing arrow labeled "CHECK IN" and a left-pointing arrow labeled "CHECK OUT". The Windows taskbar at the bottom shows the time as 13:30 on 08-11-2020.

## 12. Update Room status

The screenshot shows a web application window titled "UPDATE ROOM". The main heading is "Update Room Status". The form contains the following fields:

- Customer Id (dropdown menu)
- Room Number (text input)
- Availability (text input)
- Cleaning Status (text input)

Below the form are three buttons: "CHECK", "UPDATE", and "BACK". To the right of the form is a photograph of a hotel room with two beds, a desk, and a large window.

            new Reception();

        }

    }

}
```

```
public static void main(String args[]) {  
    new Pickup();  
}  
}
```

## **T esting**

---

### *Unit Testing*

Unit testing is a testing technique in which modules are tested individually. Small individual units of source code are tested to determine whether it is fit to use or not. Different modules of games are put to test while the modules are being developed. Here modules refer to individual levels, players, scenes

### *Integration Testing*

Integration testing is the technique in which individual components or modules are grouped together and tested. It occurs after testing. The input for the integrated testing, are the modules that have already been unit tested.

### *System Testing*

System testing is conducted on the entire system as a whole to check whether the system meets its requirements or not. 'Valar Morghulis' was installed on different systems and any errors or bugs that occurred were fixed.

### Acceptance Testing

User Acceptance is defined as a type of testing performed by the Client to certify the system with respect to the requirements that was agreed upon. This testing happens in the final phase of testing before moving the software application to the Market or Production environment.

## FUTURE SCOPE

---

The world is changing rapidly and so is the meaning of the Hotel Management System. Today hotel management is not only confined to hotels but has gone deep into tourism, catering, clubs, etc. making it a very paying and an exciting career option.

With the rapid growth of the hotel industry pushed forward by foreign and domestic tourism and business travels, the demand for well trained and quality personnel too has gone up high. India is one of the preferred tourist and travel destinations. Approx 4.4 million tourists visit our country every year. The growth of 20% has been recorded in the tourist and hospitality industry over a few years and more growth is expected in coming years. At present, there are about 200 millions of jobs available in the industry, out of which 20% of the job opportunities are in India.

The Hotel Management System has a lot of enhancement options. In future more features may be added category-wise. It may try to analyze the user behaviour and preferences and accordingly suggest. All concepts can be applied to make the Hotel Management System more efficient.

## **Conclusion**

In this project we have tried my best to make user friendly software. This software can be handled by any person who has little bit of idea of computers. In this software I have tried to meet most of the requirements of the present hotel management system including maintaining details of customers, rooms, employees and drivers. I also keep provision to update the details of customers, rooms and employees. In my effort I have tried to make my software all the more user friendly but there may some features which I would like to include in my continuous attempts
